

Содержание

The option is enabled by configuration parameter in `/etc/dpi/fastdpi.conf`:

```
ad_server=www.adserver.ru
```

Here `www.adserver.ru` is the name or the address of the new content server.

The list of URLs to replace is supplied as a text file. Each line of this file contains one URL (no `http://` prefix).

For example: the list to replace ad content Yandex Direct and Google AdWords:

```
pagead2.googlesyndication.com/pagead/show_ads.js  
an.yandex.ru/system/context.js
```

The list is converted into an internal format and placed to `/var/lib/dpi`. DPI platform loads it from the latest location:

```
cat my_ad_list.txt|url2dic my_ad_list.dic  
mv my_ad_list.dic /var/lib/dpi/adlist.bin
```
