

Содержание

The "white resources" list is created in two steps: first, a text file with the list of resources is created. Second, this file is converted into internal dictionary's format by the special utility.

The file format of the "white" resources' URLs:

Each line contains one URL (no http:// prefix). For example:

```
imagehut.com/users.php?act=gallery&gal=81&page=4
3dmx.net
```

To convert into the internal format¹⁾:

```
cat my_url_list.txt|url2dic my_url_list.dic
```

The file format of the "white" names in SSL certificates:

Each line contains one [ИМЯ](#). For example:

```
*.facebook.com
www.vasexperts.ru
```

To convert into the internal format²⁾:

```
cat my_cn_list.txt|url2dic my_cn_list.dic
```

The file format of the "white" ip addresses:

Each line contains one ip <space> port's number (443):

```
78.47.115.34 443
95.211.6.92 443
```

To convert into the internal format:

```
cat my_ip_list.txt|ip2bin my_ip_list.bin
```

To place the lists into DPI configuration directory:

```
mv my_url_list.dic /var/lib/dpi/whlist.bin
mv my_cn_list.dic /var/lib/dpi/whlistcn.bin
mv my_ip_list.bin /var/lib/dpi/whlistip.bin
```
