# Installation

Watch a tutorial (english subs):  
[https://www.youtube.com/watch?v=-Nzh0jb2fyM&feature=emb\\_logo](https://www.youtube.com/watch?v=-Nzh0jb2fyM&feature=emb_logo)

Before installing or upgrading, check your Internet connection. Make sure you run scripts as root or run it using sudo.

Do not disable the standard firewall-cmd. The installation script uses it for self-configuration.

To install or upgrade, run the script: [dpiui2-rpm\\_install.sh](#)

```
sudo yum install wget  
sudo wget https://vasexperts.ru/install/dpiui2-rpm_install.sh  
sudo sh dpiui2-rpm_install.sh
```

which installs the dpiui2 rpm package. All the needed settings will be done automatically according to your system current configuration.

The installation process will install/update the following environment:

1. PHP >= 7.1
2. MariaDB >= 10.2
3. Apache
4. Composer
5. PHP SSH2 lib
6. Laravel/Lumen

Required ports will be opened, as well as cron will be launched to perform background tasks on a schedule.

The subsystem will be installed to the

```
/var/www/html/dpiui2/
```

directory

After installation, type in your browser address bar:

```
https://<VM_IP_address>/
```

**Attention!:**https is used (not http)

The following account will be created by default:

1. Login - admin
2. Password - vasexperts
