1. To find out the PID of the main process:

```
ps -ef | grep ccu
```

2. Run the command

```
ccu manage --conf /etc/ccu/ccu.conf --pid <PID of the main process> --set-log-level diagnostic
```

3. Wait 20 minutes

4. Run the command

```
ccu manage --conf /etc/ccu/ccu.conf --pid <PID of the main process> --set-log-level info
```

Commands from 2 and 4 items change the logging level, if it is set to diagnostic, then none of the above items should be done, just examine the log `/var/log/ccu/online.log`

The `/var/log/ccu/online.log` file contains the information have been accumulated in different caches yet

Also you can examine the log `/var/log/ccu/online_recv.log` file - if it is empty, then nothing comes from IPFIX
