# Update

If you have a large amount of received data, before update it is recommended to

1. Stop receivers

```
fastor-stop
```

2. Wait for the completion of inserts into the database

```
clickhouse-client --query="select * from system.processes sp where  
sp.query like 'insert into%'" | wc -l
```

3. Stop DB

```
fastor-db-stop
```

Updating is performed using the same scripts as in the [Installation](#) section.

Do not forget to execute

```
fastor-db-scheme
```

after update. This insures cases when the schema does not have time to update as a result of a long restart of the database.
