3 Assigning priorities according to the protocols

The protocol priorities (assigned by system administrator) are loaded by DPI from the file /etc/dpi/protocols.dscp.

This file is created in two steps: first one creates a text file with the list of protocols and their priorities. Second, it is converted into an internal format by a special utility.

The file format of protocols and priorities list:

Each line contains the protocol name, then space, then dscp value. For example:

dns 0x3F
skype drop
compressnet 010
ftp keep
http cs0
default keep

Full list of protocols.

DSCP value is specified as decimal, hex or octal number or as a text abbreviation.

Keywords meaning:

- drop indicates that packets must not be transmitted further. They must be dropped.
- keep shows that priority must keep its current value (typically 0).
- default means "for all remaining protocols" and allows to simplify significantly making the configuration file.

To convert into an internal format:

cat my_dscp.txt|lst2dscp protocols.dscp

To move the settings into the work directory:

mv protocols.dscp /etc/dpi/protocols.dscp

Please use my instruction! It is an atomic one. Do not use copy!
