SSG Configuration Management

Can the number of simultaneous connections be increased? Errors occur during synchronization of services with billing: ctrl : too many connections=4, max_connections=4

Yes, you can. To do this, set the parameter `ctrl_max_connection`=4 in the configuration.

How does SSG handle traffic priority by protocols? Is the traffic going to these AS considered in the overall stream or not? Will traffic pass through SSG but not be processed at all, and will netflow data be dropped?

`local_passthrough=1` — traffic passthrough.
Traffic will not be fully processed; the only place it will be accounted for is in Netflow by autonomous systems.
