Detecting DDoS attacks, BotNet activity, and visits to specific resources using triggers in QoE

[Triggers](#) are used to search data in QoE Stor based on specified parameters. When a trigger fires, one of the following actions can occur:

- Notification in GUI
- HTTP action
- Email notification

Required SSG DPI options:

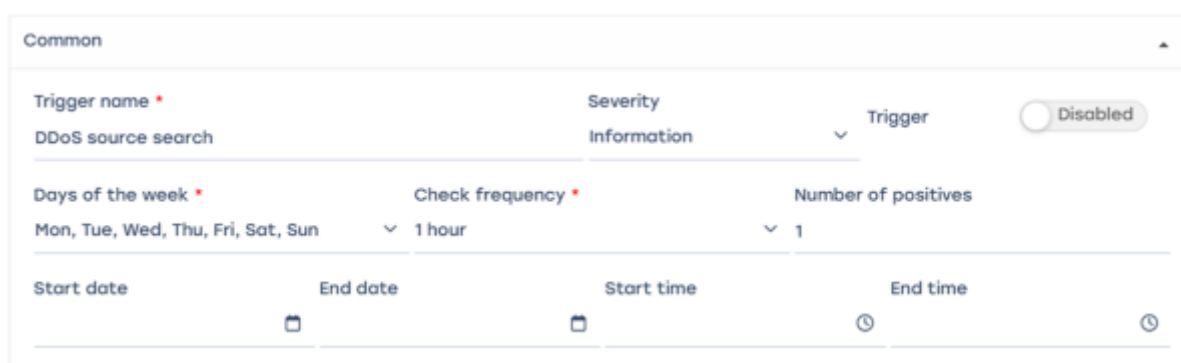

- [Statistics gathering and analysis on protocols and directions](#)
- [Subscriber notifications](#)

Required additional modules:

- [DPIUI2 \(GUI - Graphical User Interface\)](#)
- [Implementation and administration](#)

Example: configuring a trigger to detect the source of a Flood-type DDoS attack

General trigger information

The screenshot shows a configuration window titled 'Common' for a trigger named 'DDoS source search'. The trigger is currently 'Disabled'. The configuration includes the following fields:

Trigger name *	Severity	Trigger	
DDoS source search	Information	Disabled	
Days of the week *	Check frequency *	Number of positives	
Mon, Tue, Wed, Thu, Fri, Sat, Sun	1 hour	1	
Start date	End date	Start time	End time

Trigger name: "DDOS source detection", days of the week - all, check frequency - 1 hour, trigger activation frequency - once, start and end times not set.

Every day, the system will perform a check every hour based on the conditions described below.

Queries

Queries						
+						
	Query name	Report		Period from	Period to	
<input checked="" type="checkbox"/> On	A	Maxi	<input type="checkbox"/>	now - 15 minutes	now	<input type="checkbox"/>

- Add field
- Name: A
- Select table for scanning: Raw full netflow → Tables → Attacks detection → Top hosts IPs → Maxi
- Select period from “now - 15 minutes” to “now”

In this case, the system analyzes traffic for the selected page during the last 15 minutes.

Conditions

Conditions								
+								
	Bind	Query name	Function	Combinator	Serie	Operator	Value	
<input checked="" type="checkbox"/> On	AND	A	avg		Session lifetim	<=	20	<input type="checkbox"/>
<input checked="" type="checkbox"/> On	AND	A	avg		Sessions	>=	1500	<input type="checkbox"/>

- Add two "+" fields
- Link - AND
- Function - avg
- Condition 1 - session lifetime \leq 20 (ms)
- Condition 2 - number of sessions \geq 1500

This means the trigger will fire if sessions with lifetimes \leq 20ms AND more than 1500 sessions from the same IP host are detected.

Error handling

No data & error handling	
if no data *	if execution error or timeout *
No data	<input type="checkbox"/> Keep last state

- “If no errors” — no data
- “If there is an error or timeout” — save last state

In this configuration, no data will be saved if there are no errors, but if errors occur, information about suspicious sessions will be saved as a table.

Actions

E-mail action

A screenshot of a configuration interface for an "E-mail" action. The interface is titled "Actions" and has a sub-tab "E-mail" with a close button. It features a "Send to" field with the value "your@email.com" and a toggle switch set to "On". Below this is a "Subject" field with the placeholder text "Trigger fired: {trigger.name}". The "Message" field is a rich text editor with a toolbar containing various icons and a code editor icon. The message content is: "Id: {trigger.id}", "Trigger: {trigger.name}", "Status: {trigger.state}", "Severity: {trigger.severity}", "Queries: {trigger.queries}".

- Click the "</>" icon to auto-fill the form
- Enter the recipient email address in the “To” field
- When triggered, a notification will be sent to the specified email containing the trigger ID, name, status, and report link (saved state).

Notification

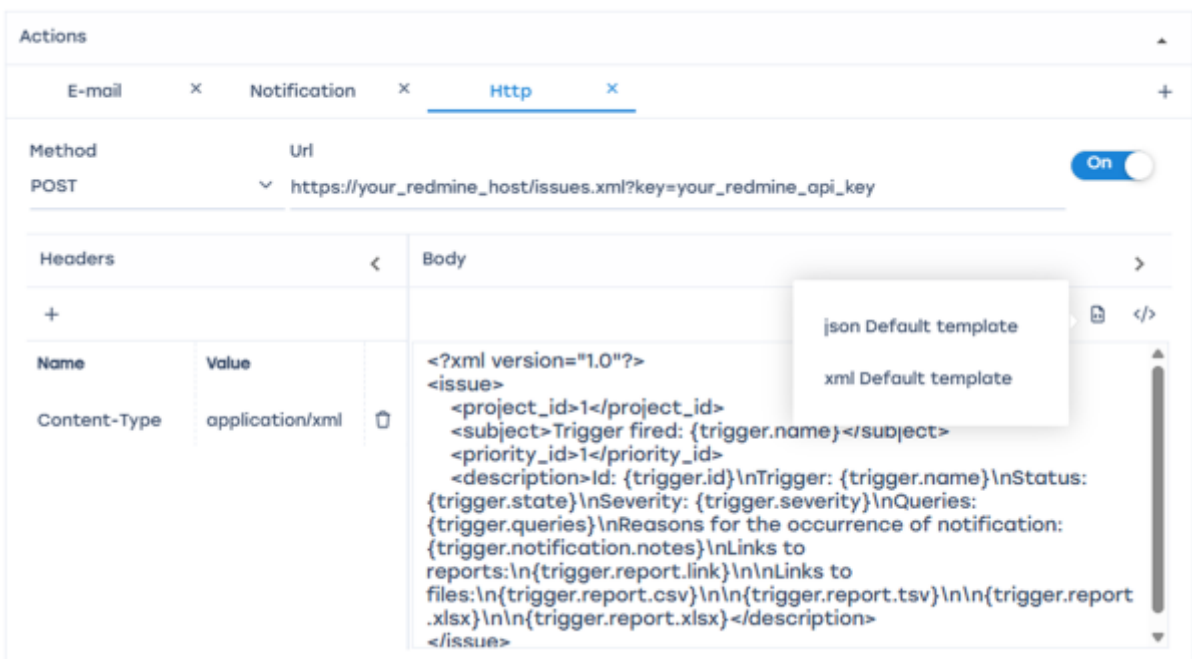

- Click "</>" to auto-fill the form
- Select notification type — “Warning”
- A notification will be created in the SSG system

The report link can be obtained from the notifications menu.

Select the notification Click **Details**

Follow the report link — it will open in a new browser window.

HTTP action

Click "</>" to auto-fill the form, select the method suitable for your ticket system, and enter the URL address.

Keep in mind — values such as session count and packet rate are averaged. Fine-tuning should be performed based on your network specifics.

Example: configuring a trigger to detect the target of a Flood-type DDoS attack

This configuration differs from the previous example in steps 2 and 3 (Queries and Conditions).

Queries

Query name	Report	Period from	Period to
A	Maxi	now - 15 minutes	now

- Raw full netflow
- Tables
- Raw log
- Attacks detection
- Top application protocols
- Top application protocols groups
- Top subscribers
- By traffic
- By flow
- By session lifetime
- By subscribers and hosts
- Maxi

Operator	Value
<=	20
>=	1500

In the report field, select Raw full netflow → Tables → Attacks detection → Top subscribers → Maxi

Conditions

Conditions							
+							
	Bind	Query name	Function	Combinator	Serie	Operator	Value
<input checked="" type="checkbox"/>	On	AND	A	avg	Flow volume t	>=	10000

Series — “Flow volume to subscribers, Pct/s” >= 10000

Values such as session count and packet rate are averaged. Fine-tuning should be performed based on your network specifics.

BotNet analysis

This configuration differs from the previous example in steps 2 and 3 (Queries and Conditions).

Queries

Queries						
+						
	Query name	Report		Period from	Period to	
<input checked="" type="checkbox"/>	On	A	Maxi	now - 15 minutes	now	
<input checked="" type="checkbox"/>	On	B	Full raw log	now - 15 minutes	now	

- Select Raw full netflow → Tables → Attacks detection → Top application protocols → Maxi for “A”
- Raw full network → Tables → Raw log → Full raw log for “B”

Conditions

Conditions							
+							
	Bind	Query name	Function	Combinator	Serie	Operator	Value
<input checked="" type="checkbox"/>	On	OR	B	avg	Destination p	=	6667
<input checked="" type="checkbox"/>	On	OR	B	avg	Source port	=	6667
<input checked="" type="checkbox"/>	On	OR	B	avg	Destination p	=	1080
<input checked="" type="checkbox"/>	On	OR	B	avg	Source port	=	1080
<input checked="" type="checkbox"/>	On	AND	A	avg	Flow	>=	2000

Since BotNet often uses ports 6667 and 1080 — add each destination/source port by selecting query “B” with “OR” condition, and Flow Pcts/s \geq 2000.

In this configuration, the trigger will fire if on any of the ports (6667/1080) the packet rate exceeds 2000 per second.

Values such as session count and packet rate are averaged. Fine-tuning should be performed based on your network specifics.

Detecting subscriber visits to competitor resources

General trigger information

Common			
Trigger name *	Severity	Trigger	<input type="checkbox"/> Disabled
Interest in competitors	Information		
Days of the week *	Check frequency *	Number of positives	
Mon, Tue, Wed, Thu, Fri, Sat, Sun	1 hour	1	
Start date	End date	Start time	End time

Trigger name: “Interest in competitors”, days of the week – all, check frequency – 1 hour, trigger activation frequency – once, start and end times not set.

Every day, the system will perform a check every hour based on the conditions described below.

Queries

Queries						
+						
	Query name	Report		Period from	Period to	
<input checked="" type="checkbox"/> On	A	Raw clickstream	▼	now - 1 hour	now	
<input checked="" type="checkbox"/> On	B	Maxi	▼	now - 1 hour	now	

- Add “+” field
- Name A — select table: Raw clickstream → Tables → Raw clickstream
- Name B — select table: Raw full netflow → Tables → Attacks detection → Top hosts IPs → Maxi
- Select period from “now - 1 hour” to “now”
- This setup analyzes traffic hourly based on the selected tables.

Conditions

Conditions							
+							
	Bind	Query name	Function	Combinator	Serie	Operator	Value
<input checked="" type="checkbox"/> On	OR	A	avg		Host	=	*megafon.ru
<input checked="" type="checkbox"/> On	AND	B	avg		Flow volume f	>=	800
<input checked="" type="checkbox"/> On	OR	A	avg		Host	=	*mts.ru

- Add 3 “+” fields
- First field — select table “A”; Link - “OR”; Function - “avg”; Series Host = *megafon.ru (or your competitor)
- Second field — select table “B”; Link - “AND”; Function - “avg”; Series Flow volume from subscriber, Pct/s >= 800

The trigger will fire if at least 800 packets (indicating a meaningful visit) from a subscriber to a competitor’s website are detected.

Error handling

- “If no errors” — no data
- “If there is an error or timeout” — save last state

In this configuration, no data will be saved if there are no errors, but if errors occur, information about suspicious sessions will be saved as a table.
