Dictionaries

Dictionary configuration

All dictionaries are located in the folder `/var/qoestor/backend/etc/db/` and have the `.txt` extension.

Each dictionary has a `sample.txt` example file that can be used as a template.

All columns in the dictionaries are separated by a tab character (`\t`). The number of `\t` characters must be one less than the number of columns in the dictionary. Pay close attention to this.

When files are modified, the data is automatically reloaded into the database.

Some useful commands for working with dictionaries:

- Speed up dictionary data refresh

```
clickhouse-client --database=qoestor --query="system reload
dictionaries"
```

- Check if there are errors in dictionaries

```
clickhouse-client --database=qoestor --query="select * from
system.dictionaries"
```

- Check if a dictionary contains data, for example, for `subnets_local_dic`

```
clickhouse-client --database=qoestor --query="select * from
subnets_local_dic"
```

In dpiui2, in the **QoE Analytics / Administrator / Dictionary Information** section, you can view a list of dictionaries, errors, and contents. See [Dictionary Information](#).

List of dictionaries

Dictionary	Description	Columns	Example	Notes
<code>asnum_dic</code>	Network AS dictionary. Cloud-based, loaded on schedule. Not editable.	1. AS number 2. AS name	0 -Reserved AS-, ZZ 1 LVLT-1, US 2 UDEL-DCN, US 3 MIT- GATEWAYS, US 4 ISI-AS, US 5 SYMBOLICS, US 6 BULL-HN, US 7 DSTL, GB 8 RICE-AS, US ...
