Out-of-line network s	schema for SKAT	3
Packet headers:		3
Router settings		3

### **Out-of-line network schema for SKAT**

(SPAN ports or optical splitter) 

if block url is detected SKAT sends HTTP redirect for browser to stub WEB page with information about blocking.

#### Packet headers:

- Destination MAC routers' MAC of port where outgoing link is pluged in
- Source MAC out\_dev NICs' MAC
- Source IP IP of blocked host (IP2)
- Destination IP users' IP (IP1)

VLAN can be keeped or cleared by configurable parameter.

To IP2 (blocked host) sending a packet with TCP RST for connection reset. Blocking (HTTPS) and redirecting (HTTP) ocures because of difference in response time between SKAT and blocked host. SKAT is close to users' IP1 then blocked IP2.

### **Router settings**

Router port where SKATs' outgoing link is pluged in has to be L3 mode as usual. Main task is receive packet from SKAT and route it by subscrider by general routing tables.

Config sample for Juniper: To Juniper MX pluged in eth1

- Juniper MX settings:
- · description from SKAT redirect;
- unit 0 {
- family inet {
- address a.b.c.d/30;
- }
- }

# **SKAT Config sample**

Let SKAT be connected as follows:

```
dna1,dna2,dna3 - receive the mirrored traffic
dna0 - is connected to the router that receives and redirects subscribers'
queries and to Internet
```

One has to configure DPI for mirrored traffic processing as follows:

First, assign the input ports that receive the mirrored traffic to in dev:

```
in_dev=dna1:dna2:dna3
```

Second, assign the ports that get the redirection request to tap dev:

```
tap dev=dna0
```

Enable asymmetric mode:

```
asym mode=1
```

Set direction of replies tap\_dev:

```
emit_direction=2
tap mode=2
```

Set to clear VLAN in outgoing packets:

```
strip_tap_tags=1
```

And configure MAC replacement:

replace\_source\_mac=00:25:90:E9:43:59 - MAC address of out\_dev card: dna0
replace\_destination\_mac=78:19:F7:0E:B1:F4 - the router port MAC address that
has a general routing table

Set number of packets repeats, for unstable delivery in networks:

```
emit_duplication=3
here 3 - number repeats of packets with redirection or RST (dublicates
packets send with RST or redirection)
```

It is advised to use an additional 1GbE network card to send the replies in mirrored traffic mode. For example, intel i350 (with DNA license) can be used. This allows to configure an individual port for sending redirection replies and to reserve 10GbE ports to receive the mirrored traffic.
