

Содержание

The option is activated by configuration parameter in `/etc/dpi/fastdpi.conf`:

```
ntf_server=192.168.0.18/ntf
```

Here `192.168.0.18/ntf` - is the name or the address of the server¹⁾ that hosts information page.

You can include a part of the path into the address. It allows using the same server for several services.

¹⁾

In case this parameter ends by `?` or `&`: the parameter `UrlRedir` is added to the formed URL. It points to a page selected by a subscriber.
